plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (http://www.genoplante.com and http://genoplante-info.infobiogen.fr).  Location/Qualifiers 1. 50 //organism="Arabidopsis thaliana" //mol_type="genomic DNA" //cultivar="Wassillewskija"	PCR was performed on DNA from transformants of Arabidopsis thaliana	Direct Submission Submitted (21-NOV-2002) Balzergue S., UMRGV, INRA/CNRS, 2 rue	Balzerque.S.	12446565 2 (hases 1 to 50)	of pre-insertion sites EMBO Rep. 3 (12), 1152-1157 (2002)	Lepiniec, L., Caboche, M. and Lecharny, A. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site www.zmdb.iastate.edu and follow the links for 'RescueMu.' Grid I was grown at Berkeley in 2001. DNA was extracted from last punches, double digested using BamHI and BgIII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

The invention relates to a method of assigning an expression pattern of transposable elements to the level of developmental potential of a cell

Disclosure; SEQ ID NO 518; 50pp; English

Assigning an expression pattern of transposable elements to the level of developmental potential of a cell comprises determining expression of one or more families of transposable elements, and assigning the expression pattern.

WPI; 2004-804756/79.

Mcdonald JF;

Also disclosed are a CC method of identifying a cellular differentiation induction factor, a CC method of identifying a factor that increases the developmental potential of a stem cell, a cell, a method of assigning a methylation pattern of transposable celements to the level of developmental potential of a cell, and a method of assigning a methylation pattern of transposable clements to the level of developmental potential of a cell, and a method of assigning a transposable celements to the level of developmental potential of a cell, and a method of a cell, the cell is a fully pluripotent stem cell, a pluripotent stem cell, or a differentiated cell. The expression pattern is determined by microarray analysis. One or more of the families of transposable elements cell, or DNA element families. One or more of the families of compositing of the transposable elements (SINES) and a family of long interspersed nuclear elements (SINES) and a family of long interspersed nuclear elements cell assaying for the mRNA transcribed from the genes or proteins translated from an mRNA transcribed from the genes or proteins translated from an mRNA transcribed from the genes or proteins translated cell monitored by enzymatic means, microarray analysis, or methylation-genes in monitored by enzymatic means, microarray analysis, or methylation-genes in pattern of transposable elements to the level of developmental contential of a cell. This sequence represents an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

Assigning an expression pattern of transposable elements to the level on developmental potential of a cell comprises determining expression of or more families of transposable elements, and assigning the expression

pattern.

```
cc sample comprises determining expression, methylation or chromatin status of one or more families of transposable elements. Also included are a cc method of assigning an expression pattern of transposable elements to a ctype of cancerous cell in a sample, a method of diagnosing cancer, a cc method of determining the effectiveness of an anti-cancer therapeutic in cc a subject, a method of assigning a methylation pattern of one or more families of transposable elements to a type of cancerous cell in a sample can determining an expression, methylation or chromatin status pattern of transposable elements to a type of cancerous cell in a sample. The method is useful in cc determining an expression, methylation or chromatin status pattern of one or more families of transposable elements (e.g. LINE, long interspersed cc endogenous retrovirus) in a sample for diagnosing cancer or determining the effectiveness of an anti-cancer therapeutic. The presentations of the transposable element, used in a microarray to study the expression, methylation or chromatin status pattern of the transposable element, used in a microarray to study the expression, methylation or chromatin status cc pattern of the transposable elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        families of transposable elements in a sample e.g. for diagnosing cancer, comprises determining the expression, methylation or chromatin status of the elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to determining expression, methylation or status pattern of one or more families of transposable elements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        IJ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NO 518; 68pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chromatin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC The invention relates to a method of assigning an expression pattern of CC transposable elements to the level of developmental potential of a cell. CC of transposable elements, and assigning the expression of one or more families CC of transposable elements, and assigning the expression pattern obtained CC method of determining the developmental potential of a stem cell, a CC method of identifying a cellular differentiation induction factor, a CC method of identifying a factor that increases the developmental potential of a stem cell, a method of assigning a methylation pattern of transposable CC elements to the level of developmental potential of a cell, and a method CC of assigning a chromatin status pattern of transposable elements to the level of developmental potential of a cell. In assigning an expression CC pattern of transposable elements to the level of developmental potential of a cell, and a method CC of a cell, the cell is a fully pluripotent stem cell, a pluripotent stem CC cell, or a differentiated cell. The expression pattern is determined by CC microarray analysis. One or more of the families of transposable elements (CC language) and a family of long interspersed nuclear cell cendents (SINES) and a family of long interspersed nuclear elements (SINES) and a family of long interspersed nuclear elements (CC cendents (SINES) and a family of short interspersed nuclear elements (SINES) and a family of seven the genes or proteins translated CC from an mRNA transcribed from the genes or proteins translated CC from an mRNA transcribed from the genes or proteins translated CC from an mRNA transcribed from the genes or proteins translated CC from an mRNA transcribed from the genes or proteins translated CC from an mRNA transcribed from the genes or proteins translated CC from an mRNA transcribed from the genes or proteins translated CC from 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The expression of two or more families of transposable elements is determined and used to form the pattern of expression. The methylation of the transposable element gene is monitored by enzymatic means, microarray analysis, or methylation-specific PCR. The methylation pattern is determined by microarray analysis. The methods of the invention are useful for assigning an expression pattern of transposable elements to the level of development potential of a cell. This sequence represents an oligonucleotide

method of assigning an expression pattern of transposable elements to a crown of transposable elements to a comment of transposable elements to a comment of transposable elements to a comment of transposable elements of an anti-cancer therapeutic in a subject, a method of assigning a methylation pattern of one or more comment of transposable elements to a type of cancerous cell in a sample and a method of assigning a chromatin status pattern of transposable elements to a type of cancerous cell in a sample. The method is useful in determining an expression, methylation or chromatin status pattern of one or more families of transposable elements (e.g. LINE, long interspersed nuclear element, SINE, short interspersed nuclear element, or the elements of the effectiveness of an anti-cancer thrasposable element, or the effectiveness of an anti-cancer thrasposable element, or the present sequence is a representative sequence for a human transposable element, used in a committee of the transposable elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to determining expression, methylation or chromating status pattern of one or more families of transposable elements in a sample comprises determining expression, methylation or chromating status of one or more families of transposable elements. Also included are a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining expression, methylation or chromatin status pattern of families of transposable elements in a sample e.g. for diagnosing cancer comprises determining the expression, methylation or chromatin status of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; SEQ ID NO 770; 68pp;

```
CT The method comprises determining the expression of one or more families of transposable elements, and assigning the expression pattern obtained to the level of developmental potential of a cell. Also disclosed are a care a method of determining the developmental potential of a stem cell, a care a ca

The invention relates to determining expression, methylation or chromatin CC status pattern of one or more families of transposable elements in a CC sample comprises determining expression, methylation or chromatin status of one or more families of transposable elements. Also included are a CC type of cancerous cell in a sample, a method of diagnosing cancer, a CC method of determining the effectiveness of an anti-cancer therapeutic in a subject, a method of assigning a methylation pattern of one or more CC families of transposable elements to a type of cancerous cell in a sample canded and a method of assigning a chromatin status pattern of the sample CC and a method of assigning a chromatin status pattern of transposable elements to a type of cancerous cell in a sample. The method is useful in CC determining an expression, methylation or chromatin status pattern of one or more families of transposable elements (e.g. LINE, long interspersed CC unclear element, SINE, short interspersed nuclear element, or HERV, human CC endogenous retrovirus) in a sample for diagnosing cancer or determining cancerous sequence is a representative sequence for a human transposable element, used in a microarray to study the expression, methylation or chromatin status

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of transposable elements, and assigning the expression pattern obtained to the level of developmental potential of a cell. Also disclosed are a method of determining the developmental potential of a stem cell, a method of identifying a cellular differentiation induction factor, a method of identifying a factor that increases the developmental potential of a cell, a method of assigning a methylation pattern of transposable elements to the level of developmental potential of a cell, and a method of assigning a methylation pattern of transposable clements of assigning and a method of assigning a chromatin status pattern of transposable elements to the level of developmental potential of a cell, and a method of assigning a chromatin status pattern of transposable elements to the level of developmental potential of a cell, or a differentiated cell. The expression pattern is determined by microarray analysis. One or more of the families of transposable elements families of retroelement families, or DNA element families. One or more of the families of retroelements is selected from the group consisting of elements (SINES) and a family of long interspersed nuclear elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The expression of two or more families of transposable elements is determined and used to form the pattern of expression. The methylation of the transposable element geneis monitored by enzymatic means, microarray analysis, or methylation-
                                                         Expression pattern; transposable element; developmental potential; stem cell; cellular differentiation induction factor; methylation pattern; chromatin status pattern; endogenous retrovir ERV; short interspersed nuclear element; SINE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specific PCR. The methylation pattern is determined by microarray analysis. The methods of the invention are useful for assigning an expression pattern of transposable elements to the level of developmental potential of a cell. This sequence represents an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assigning an expression pattern of transposable elements to the level of developmental potential of a cell comprises determining expression of or more families of transposable elements, and assigning the expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of assigning a chromatin status pattern of transposable elements to the level of developmental potential of a cell. In assigning an expression pattern of transposable elements to the level of developmental potential of a cell, the cell is a fully pluripotent stem cell, a pluripotent stem cell, or a differentiated cell. The expression pattern is determined by microarray analysis. One or more of the families of transposable elements are retroelement families, or DNA element families. One or more of the families of retroelements is selected from the group consisting of
                                                                                                                                                                                                                                                                          is monitored by enzymatic means, microarray analysis, or methylation-
specific PCR. The methylation pattern is determined by microarray
analysis. The methods of the invention are useful for assigning an
expression pattern of transposable elements to the level of developmental
potential of a cell. This sequence represents an oligonucleotide
identifier of a retroelement consensus sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   endogenous retroviruses (ERVs), a family of short interspersed nuclear elements (SINES) and a family of long interspersed nuclear elements (LINES). The expression of the transposable elements is measured by assaying for the mRNA transcribed from the genes or proteins translated from an mRNA transcribed from the genes. The expression of two or more families of transposable elements is determined and used to form the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of transposable elements, and assigning the expression pattern obtained to the level of developmental potential of a cell. Also disclosed are a method of determining the developmental potential of a stem cell, a method of identifying a cellular differentiation induction factor, a method of identifying a factor that increases the developmental potential of a cell, a method of assigning a methylation pattern of transposable elements to the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell, and a method of second control of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of a cell of the level of developmental potential of the level of th

                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to determining expression, methylation or chromatin CC status pattern of one or more families of transposable elements in a CC sample comprises determining expression, methylation or chromatin status of one or more families of transposable elements. Also included are a CC method of assigning an expression pattern of transposable elements to a CC method of determining the effectiveness of an anti-cancer therapeutic in CC method of determining the effectiveness of an anti-cancer therapeutic in CC dements to a method of assigning a methylation pattern of one or more CC families of transposable elements to a type of cancerous cell in a sample CC and a method of assigning a chromatin status pattern of transposable elements to a type of cancerous cell in a sample. The method is useful in CC determining an expression, methylation or chromatin status pattern of one or more families of transposable elements (e.g. LINE, long interspersed CC nuclear element, SINE, short interspersed nuclear element, or HERV, human CC endogenous retrovirus) in a sample for diagnosing cancer or determining the effectiveness of an anti-cancer therapeutic. The present sequence is a representative sequence for a human transposable element, used in a microarray to study the expression, methylation or chromatin status
                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to determining expression, methylation or chromatin CC status pattern of one or more families of transposable elements in a CC sample comprises determining expression, methylation or chromatin status of one or more families of transposable elements. Also included are a CC method of assigning an expression pattern of transposable elements to a CC method of determining the effectiveness of an anti-cancer therapeutic in CC method of determining the effectiveness of an anti-cancer therapeutic in CC determining the elements to a type of cancerous cell in a sample of an ambject, a method of assigning a methylation pattern of transposable elements to a type of cancerous cell in a sample of and a method of assigning a chromatin status pattern of transposable of transposable elements (e.g. LINE, long interspersed cor more families of transposable elements (e.g. LINE, long interspersed cor more families of transposable elements (e.g. LINE, long interspersed cor endogenous retrovirus) in a sample for diagnosing cancer or determining cancerous retrovirus) in a sample for diagnosing cancer or determining cancerous sequence is a representative sequence for a human transposable element, used in a microarray to study the expression, methylation or chromatin status
                                                                                                                                                                                                                                                                                                                                                                        Query Match

Also disclosed is a method for curing several diseases, such as malignant tumour, haemopathy, Human Immunodeficiency virus (HIV) infection, immunological disease and various inflammations. The invention also discloses the antagonist for resisting this polypeptide, and its therapeutic action. The current sequence represents a quinoprotein dehydrogenes 13 for other products are presents a quinoprotein dehydrogenes.
                                                                                                                                                                                                                                                         Human; drug metabolising enzyme; gene; drug metabolism; chromosome polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP;

Human organic anion transporter OATP2 gene polymorphic site,

Homo sapiens

```
CC one polymorphism is such drug metabolising enzyme-encoding genes. The CP polymorphism have identified in a nucleic acid sample using probes or CP primers specific for a sequence selected from ABZ43217-ABZ50887 using a CC variety of detection assays, including hybridisation assays, nucleic acid convariety of detection assays, including hybridisation assays, nucleic acid convariety of detection assays, including hybridisation assays, nucleic acid convariety of detection assays, nucleic acid convariety of detection assays, nucleic acid convariety of surface acid convariety of activations and particularly that relating to single nucleotide convariety of activations and human diseases, conditions, and responses to converge that cause or exacerbate certain diseases, conditions, and responses to that cause or exacerbate certain diseases, conditions, and responses to that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations come are peating sequences. The detection and analysis of polymorphisms converge therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. CC methods of the invention are also useful in the drug discovery and the convergence of their genetic profiles individual be selected for capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more capacitate patient populations. The methods, data and compositions of the inventions of the profile of the patients of the patient of the patients of the patient of the patients of the patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying individuals having a polymorphism, useful for determining effectiveness or side effect of a drug or treatment protocol, comprise detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.

CC evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide polymorphism (SNPB), may be used in studying the relationship between CC polymorphisms (SNPB), may be used in studying the relationship between CC that cause or exacerbate certain diseases, conditions, and responses to that cause or exacerbate certain diseases. SNPB are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations of in genes encoding drug metabolising enzymes allows the customisation of CC drug therapeutic effect for a particular patients. This would not only take the genetic profile of individual patients. CC This would not only take the genetic profile of individual patients. CC reduce the likelihood of adverse reactions, thereby increasing safety. CC reduce the likelihood of adverse reactions, thereby increasing safety. CC reduce the likelihood of adverse reactions, thereby increasing safety. CC clinical trials only if their genetic profiles indicate that they are CC capable of responding to a particular drug ording to a particular drug of drug class, and previously cfailed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a na increase in the range of cc possible drug targets and decreases in the number of adverse drug class, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy xxx
                                                                                                                                                      Matches
                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  27-DEC-2000; 2000JP-00399443

                                                                                                               co of a cell, a method of assigning a methylation pattern of transposable cell elements to the level of developmental potential of a cell, and a method of assigning a chromatin status pattern of transposable elements to the cell evel of developmental potential of a cell. In assigning an expression cell evel of developmental potential of a cell. In assigning an expression cell, the cell is a fully pluripotent stem cell, a pluripotent stem cell, or a differentiated cell. The expression pattern is determined by cell or a cell in a ce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transposable elements to the level of developmental potential of a cell. The method comprises determining the expression of one or more families of transposable elements, and assigning the expression pattern obtained to the level of developmental potential of a cell. Also disclosed are a method of identifying a cellular differentiation induction factor, a method of identifying a factor that increases the developmental potential potential potential potential potential potential potential potential cellular differentiation induction factor, a method of identifying a factor that increases the developmental potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of assigning an expression pattern of transposable elements to the level of developmental potential of a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Assigning an expression pattern of transposable elements to the level developmental potential of a cell comprises determining expression of or more families of transposable elements, and assigning the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               methylation pattern; chromatin status pattern; endogenous retrovirus; ERV; short interspersed nuclear element; SINE; retroelement; ss.

ADU22743
     The invention relates to determining expression, methylation or chromatin CC status pattern of one or more families of transposable elements in a CC sample comprises determining expression, methylation or chromatin status CC of one or more families of transposable elements. Also included are a CC method of assigning an expression pattern of transposable elements to a CC type of cancerous cell in a sample, a method of diagnosing cancer, a CC method of determining the effectiveness of an anti-cancer therapeutic in CC a subject, a method of assigning a methylation pattern of one or more CC families of transposable elements to a type of cancerous cell in a sample CC and a method of assigning a chromatin status pattern of transposable elements to a type of cancerous cell in a sample. The method is useful in CC determining an expression, methylation or chromatin status pattern of one CC or more families of transposable elements (e.g. LINE, long interspersed nuclear element, SINE, short interspersed nuclear element, or HERV, human CC the effectiveness of an anti-cancer therapeutic. The present sequence is a representative sequence for a human transposable element, used in a CC microarray to study the expression, methylation or chromatin status CC pattern of the transposable elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ई

            10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Biomedical Polymers Research Bldg.,

pBlueScript backbone); Site 1: BamHI; Site 2: BgIII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site www.zmdb.iastate.edu and follow the links for
'RescueMu.' Grid I was grown at Berkeley in 2001. DNA was
extracted from leaf punches, double digested using BamHI
and BgIII, and ligated to form circular plasmids. DH10B

        was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNP42 (gi | 4732.14 | gb | AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Laboratory Mouse DNA Resource

(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD2 (gi|473214|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Euchtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion close to or within gene At5942400. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.
